Question # 1:

Modify the merge sort algorithm to count the number of inversions in arrays. An inversion is a pair of indices (i, j) such that i < j and arr[i] > arr[j].

Program And Output:

```
no of inversion.py X
no of inversion.py > ..
       def merge(arr, left, mid, right):
           inv_count = 0
           left_arr = arr[left:mid + 1]
           right_arr = arr[mid + 1:right + 1]
  6
           k = left
  8
  9
           while i < len(left\_arr) and j < len(right\_arr):
 10
                if left_arr[i] <= right_arr[j]:
    arr[k] = left_arr[i]</pre>
 12
 14
                   arr[k] = right_arr[j]
 16
 17
                    inv_count += (len(left_arr) - i) # Counting inversions
 18
 19
           while i < len(left_arr):
 20
               arr[k] = left_arr[i]
 22
                i += 1
               k += 1
 24
           while j < len(right_arr):</pre>
               arr[k] = right_arr[j]
 26
 28
                k += 1
 29
 30
           return inv_count
 31
       def mergeSort(arr, left, right):
 33
           inv count = 0
 34
           if left < right:</pre>
               mid = (left + right) // 2
 36
 37
                inv_count += mergeSort(arr, left, mid)
```

Question # 2:

Implement the merge sort algorithm for sorting linked lists instead of arrays. This exercise will require modifying the merge process..

Program And Output:

```
no of inversion.py
                     sort linked list.py X
sort linked list.py >
           def __init__(self, value=0, next=None):
               self.val = value
self.next = next
       def findMiddle(head):
           slow = head
           fast = head.next if head else None
           while fast and fast.next:
               slow = slow.next
               fast = fast.next.next
           return slow
       def merge(left, right):
           dummy = ListNode(0)
           current = dummy
 20
           while left and right:
               if left.val < right.val:</pre>
                   current.next = left
                   left = left.next
                   current.next = right
                   right = right.next
               current = current.next
           current.next = left or right
 30
           return dummy.next
       def mergeSort(head):
 34
           if not head or not head.next:
              return head
 36
           middle = findMiddle(head)
```

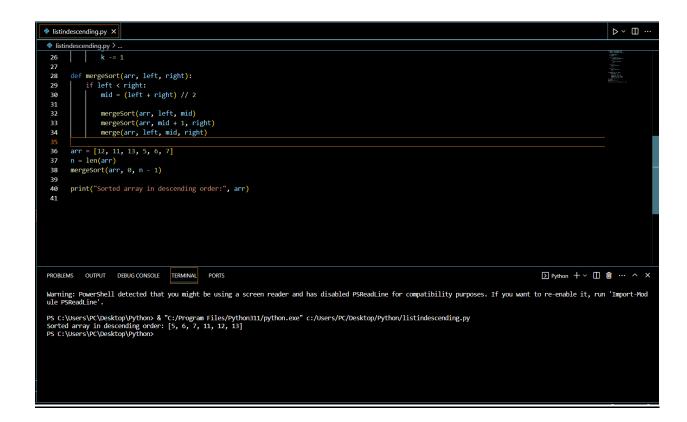

Question #3:

Modify the merge sort algorithm for a sort list in descending order instead of ascending order. This will require changes to the merging step.

Input And Output:

```
listindescending.py
 listindescending.py >.
           def merge(arr, left, middle, right):
    left_arr = arr[left:middle + 1]
    right_arr = arr[middle + 1:right + 1]
                  i = len(left_arr) - 1
j = len(right_arr) - 1
k = right
                  while i >= 0 and j >= 0:
    if left_arr[i] >= right_arr[j]:
        arr[k] = left_arr[i]
        i -= 1
   10
   11
   12
   14
                             arr[k] = right_arr[j]
   15
   16
   17
                   while i >= 0:
   18
                         arr[k] = left_arr[i]
   19
   20
   21
                  while j >= 0:
    arr[k] = right_arr[j]
  23
24
   25
   26
            def mergeSort(arr, left, right):
    if left < right:
        mid = (left + right) // 2</pre>
   28
   30
                         mergeSort(arr, left, mid)
   32
                       mergeSort(arr, mid + 1, right)
merge(arr, left, mid, right)
  36 arr = [12, 11, 13, 5, 6, 7]
37 n = len(arr)
```

Question # 4:

Extend the merge sort algorithm to work with three or more sub lists at each stop. not just two. This is called a three way (or multi-way) merge sort.

Input And Output:

```
no of inversion.py sort linked list.py extend mergesort.py X
                                                                                                                                                                                                                                                               D ~
